

CLAIMSWhat Is Claimed Is:

5        1. An electric field activated optical switch comprising a molecular system configured within an electric field generated by a pair of electrodes, said molecular system having an electric field induced band gap change that occurs via one of the following mechanisms:

10                (1) molecular conformation change or an isomerization;

                  (2) change of extended conjugation via chemical bonding change to change the band gap; or

                  (3) molecular folding or stretching.

15        2. The optical switch of Claim 1 wherein said electric field induced band gap change occurs via molecular conformation change or an isomerization.

20        3. The optical switch of Claim 2 wherein said molecular system comprises at least one stator portion and at least one rotor portion, wherein said rotor rotates from a first state to a second state with an applied electric field, wherein in said first state, there is extended conjugation throughout said molecular system, resulting in a relatively smaller band gap, and wherein in said second state, said extended conjugation is destroyed, resulting in a relatively larger band gap.

                  4. The optical switch of Claim 3 wherein said molecular system comprises

25

where:

5  $A^-$  is an Acceptor group comprising an electron-withdrawing group selected from the group consisting of: (a) hydrogen, (b) carboxylic acid and its derivatives, (c) sulfuric acid and its derivatives, (d) phosphoric acid and its derivatives, (e) nitro, (f) nitrile, (g) hetero atoms selected from the group consisting of N, O, S, P, F, Cl, and Br, (h) functional groups with at least one of said hetero atoms, (i) saturated or unsaturated hydrocarbons, and (j) substituted hydrocarbons;

10  $D^+$  is a Donor group comprising an electron-donating group selected from the group consisting of: (a) hydrogen, (b) amines, (c) OH, (d) SH, (e) ethers, (f) saturated or unsaturated hydrocarbon, (g) substituted hydrocarbons, and (h) functional groups with at least one hetero atom selected from the group consisting of B, Si, I, N, O, S, and P, wherein said Donor group is more electropositive than said Acceptor group;

15  $Con_1$  and  $Con_2$  are connecting units between one molecule and another molecule or between a molecule and a solid substrate selected from the group consisting of a metal electrode, an inorganic substrate, and an organic substrate, said connecting units independently selected from the group consisting of: (a) hydrogen (utilizing a hydrogen bond), (b) multivalent hetero atoms selected from the group consisting of C, 20 N, O, S, and P, (c) functional groups containing said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons; and

SA and SB designate Stator A and Stator B, respectively, which may be the same or different and which are independently selected from the group consisting of (a) unsaturated or saturated hydrocarbons and (b) substituted hydrocarbons, wherein 25 said hydrocarbon units contain conjugated rings that contribute to an extended conjugation of the molecule when it is in a planar state (red shifted state), wherein said stators optionally and separately contain at least one bridging group  $G_n$ , at least one spacing group  $R_n$ , or both, wherein said at least one bridging group is either (a) selected from the group consisting of acetylene, ethylene, amide, imide, imine, and azo 30 and is used to connect said stators to said rotor or to connect at least two conjugated rings to achieve a desired chromophore or (b) selected from the group consisting of a

single atom bridge and a direct sigma bond between said rotor and said stators and wherein said at least one spacing group is selected from the group consisting of phenyl, isopropyl, and tert-butyl and is used to provide an appropriate 3-dimensional scaffolding to allow molecules to pack together while providing rotational space for 5 each rotor to rotate over a desired range of motion.

5. The optical switch of Claim 4 wherein said molecular system comprises

10

where:

$A^-$  is said Acceptor group;

$D^+$  is said Donor group;

$Con_1$  and  $Con_2$  are said connecting units;

$R_1$ ,  $R_2$ ,  $R_3$  are said spacing groups, which are independently selected from the group consisting of: (a) hydrogen, (b) saturated or unsaturated hydrocarbons, and (c) 5 substituted hydrocarbons; and

$G_1$ ,  $G_2$ ,  $G_3$ , and  $G_4$  are said bridging groups, which are independently selected from the group consisting of: (a) hetero atoms selected from the group consisting of N, O, S, and P, (b) functional groups with at least one of said hetero atoms, (c) saturated or unsaturated hydrocarbons, and (d) substituted hydrocarbons.

10

6. The optical switch of Claim 3 wherein said molecular system comprises:

where:

15  $A^-$  is an Acceptor group comprising an electron-withdrawing group selected from the group consisting of: (a) hydrogen, (b) carboxylic acid and its derivatives, (c) sulfuric acid and its derivatives, (d) phosphoric acid and its derivatives, (e) nitro, (f) nitrile, (g) hetero atoms selected from the group consisting of N, O, S, P, F, Cl, and Br, (h) functional groups with at least one of said hetero atoms, (i) saturated or unsaturated hydrocarbons, and (j) substituted hydrocarbons;

20  $D^+$  is a Donor group comprising an electron-donating group selected from the group consisting of: (a) hydrogen, (b) amines, (c) OH, (d) SH, (e) ethers, (f) saturated or unsaturated hydrocarbon, (g) substituted hydrocarbons, and (h) functional groups with at least one hetero atom selected from the group consisting of B, Si, I, N, O, S, 25 and P, wherein said Donor group is more electropositive than said Acceptor group;

$Con_1$  and  $Con_2$  are connecting units between one molecule and another molecule or between a molecule and a solid substrate selected from the group consisting of

a metal electrode, an inorganic substrate, and an organic substrate, said connecting units independently selected from the group consisting of: (a) hydrogen (utilizing a hydrogen bond), (b) multivalent hetero atoms selected from the group consisting of C, N, O, S, and P, (c) functional groups containing said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons; and

SA and SB designate Stator A and Stator B, respectively, which may be the same or different and which are independently selected from the group consisting of (a) unsaturated or saturated hydrocarbons and (b) substituted hydrocarbons, wherein said hydrocarbon units contain conjugated rings that contribute to an extended conjugation of the molecule when it is in a planar state (red shifted state), wherein said stators optionally and separately contain at least one bridging group  $G_n$ , at least one spacing group  $R_n$ , or both, wherein said at least one bridging group is either (a) selected from the group consisting of acetylene, ethylene, amide, imide, imine, and azo and is used to connect said stators to said rotor or to connect at least two conjugated rings to achieve a desired chromophore or (b) selected from the group consisting of a single atom bridge and a direct sigma bond between said rotor and said stators and wherein said at least one spacing group is selected from the group consisting of phenyl, isopropyl, and tert-butyl and is used to provide an appropriate 3-dimensional scaffolding to allow molecules to pack together while providing rotational space for each rotor to rotate over a desired range of motion.

7. The optical switch of Claim 6 wherein said molecular system comprises:

where:

$A^-$  is said Acceptor group;

$D^+$  is said Donor group;

5  $Con_1$  and  $Con_2$  are said connecting units;

$R_1$ ,  $R_2$  and  $R_3$  are said spacing groups, which are independently selected from the group consisting of: (a) hydrogen, (b) saturated or unsaturated hydrocarbons, and (c) substituted hydrocarbons;

$G_1$ ,  $G_2$ ,  $G_3$ ,  $G_4$ ,  $G_5$ ,  $G_6$ ,  $G_7$ , and  $G_8$  are said bridging groups, which are independently selected from the group consisting of: (a) hetero atoms selected from the group consisting of N, O, S, and P, (b) functional groups with at least one of said hetero atoms, (c) saturated or unsaturated hydrocarbons, and (d) substituted hydrocarbons; and

5  $J_1$  and  $J_2$  are tuning groups to provide at least one appropriate functional effect selected from the group consisting of inductive effects, resonance effects, and steric effects, said tuning groups being selected from the group consisting of: (a) hydrogen, (b) hetero atoms selected from the group consisting of N, O, S, P, B, F, Cl, Br and I, 10 (c) functional groups with at least one of said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons.

8. The optical switch of Claim 1 wherein said electric field induced band gap occurs via a change of extended conjugation via chemical bonding change to change the 15 band gap.

9. The optical switch of Claim 8 wherein said electric field induced band gap change occurs via a change of extended conjugation via charge separation or recombination accompanied by increasing or decreasing band localization.

20

10. The optical switch of Claim 9 wherein said molecular system comprises two portions, wherein a change from a first state to a second state occurs with an applied electric field, said change involving charge separation in changing from said first state to said second state, thereby resulting in a relatively larger band gap state, with less  $\pi$ -delocalization, and recombination of charge in changing from said second state to said first state, thereby resulting in a relatively smaller band gap state, with greater  $\pi$ -delocalization.

25

11. The optical switch of Claim 10 wherein said molecular system comprises:

where:

5  $J_1, J_2, J_3, J_4$  and  $J_5$  are tuning groups to provide at least one appropriate functional effect selected from the group consisting of inductive effects, resonance effects,

and steric effects, said tuning groups being selected from the group consisting of: (a) hydrogen, (b) hetero atoms selected from the group consisting of N, O, S, P, B, F, Cl, Br and I, (c) functional groups with at least one of said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons;

5         $G_1$  is a bridging group to connect at least two conjugated rings to achieve a desired chromophore, said bridging group selected from the group consisting of: (a) hetero atoms selected from the group consisting of N, O, S, and P, (b) functional groups with at least one of said hetero atoms, (c) saturated or unsaturated hydrocarbons, and (d) substituted hydrocarbons; and

10         $W$  is an electron-withdrawing group for tuning reactivity of the maleic anhydride group of said molecular system, which enables said molecular system to undergo a smooth charge separation or recombination upon application of said electric field, said electron-withdrawing group selected from the group consisting of: (a) carboxylic acid and its derivatives, (b) nitro, (c) nitrile, (d) ketone, (e) aldehyde, (f) sulfone, (g) 15 sulfuric acid and its derivatives, (h) hetero atoms selected from the group consisting of F, Cl, Br, N, O and S, and (i) functional groups with at least one of said hetero atoms.

12. The optical switch of Claim 10 wherein said molecular system comprises:

where:

5  $J_1, J_2, J_3, J_4$  and  $J_5$  are tuning groups to provide at least one appropriate functional effect selected from the group consisting of inductive effects, resonance effects, and steric effects, said tuning groups being selected from the group consisting of: (a) hydrogen, (b) hetero atoms selected from the group consisting of N, O, S, P, B, F, Cl, Br and I, (c) functional groups with at least one of said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons;

$G_1$  is a bridging group to connect at least two conjugated rings to achieve a desired chromophore, said bridging group selected from the group consisting of: (a) hetero atoms selected from the group consisting of N, O, S, and P, (b) functional groups with at least one of said hetero atoms, (c) saturated or unsaturated hydrocarbons, and

5 (d) substituted hydrocarbons; and

$M^+$  is selected from the group consisting of transition metals, their halogen complexes,  $H^+$ , and Lewis acids.

13. The optical switch of Claim 8 wherein said electric field induced band gap  
10 occurs via a change of extended conjugation via charge separation or recombination and  
 $\pi$ -bond breaking or formation.

14. The optical switch of Claim 13 wherein said molecular system comprises  
two portions, wherein a change from a first state to a second state occurs with an applied  
15 electric field, said change involving charge separation in changing from said first state to  
said second state, wherein in said first state, there is extended conjugation throughout  
said molecular system, resulting in a relatively larger band gap state, and wherein in said  
second state, said extended conjugation is destroyed and separated positive and negative  
charges are created within said molecular system, resulting in a relatively smaller band  
20 gap state.

15. The optical switch of Claim 14 wherein said molecular system comprises:

where:

Q is a connecting unit between two phenyl rings and is selected from the group consisting of: S, O, NH, NR, hydrocarbon, or substituted hydrocarbon;

Con<sub>1</sub> and Con<sub>2</sub> are connecting units between one molecule and another molecule or between a molecule and a solid substrate selected from the group consisting of a metal electrode, an inorganic substrate, and an organic substrate, said connecting units independently selected from the group consisting of: (a) hydrogen (utilizing a hydrogen bond), (b) multivalent hetero atoms selected from the group consisting of C, N, O, S, and P, (c) functional groups containing said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons;

R<sub>1</sub> and R<sub>2</sub> are spacing groups for providing an appropriate 3-dimensional scaffolding to allow molecules to pack together while providing rotational space for each rotor, said spacing groups selected from the group consisting of: (a) hydrogen, (b) saturated or unsaturated hydrocarbon, and (c) substituted hydrocarbon;

J<sub>1</sub>, J<sub>2</sub>, J<sub>3</sub>, and J<sub>4</sub> are tuning groups to provide at least one appropriate functional effect selected from the group consisting of inductive effects, resonance effects, and steric effects, said tuning groups being selected from the group consisting of: (a) hydrogen, (b) hetero atoms selected from the group consisting of N, O, S, P, B, F, Cl, Br and I, (c) functional groups with at least one of said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons;

G<sub>1</sub> is a bridging group to connect either (a) a stator portion and a rotor portion of said molecular system or (b) at least two conjugated rings to achieve a desired chromophore, said bridging group selected from the group consisting of: (a) hetero atoms selected from the group consisting of N, O, S, and P, (b) functional groups with at least one of said hetero atoms, (c) saturated or unsaturated hydrocarbons, and (d) substituted hydrocarbons; and

W is an electron-withdrawing group for tuning reactivity of the maleic anhydride group of said molecular system, which enables said molecular system to undergo a smooth charge separation or recombination upon application of said electric field, said electron-withdrawing group selected from the group consisting of: (a) carboxylic acid and its derivatives, (b) nitro, (c) nitrile, (d) ketone, (e) aldehyde, (f) sulfone, (g) sulfuric acid and its derivatives, (h) hetero atoms selected from the group consisting of F, Cl, Br, N, O and S, and (i) functional groups with at least one of said hetero atoms.

16. The optical switch of Claim 14 wherein said molecular system comprises:

where:

Q is a connecting unit between two phenyl rings and is selected from the group consisting of: S, O, NH, NR, hydrocarbon, or substituted hydrocarbon;

Con<sub>1</sub> and Con<sub>2</sub> are connecting units between one molecule and another molecule or between a molecule and a solid substrate selected from the group consisting of a metal electrode, an inorganic substrate, and an organic substrate, said connecting units independently selected from the group consisting of: (a) hydrogen (utilizing a hydrogen bond), (b) multivalent hetero atoms selected from the group consisting of C, N, O, S, and P, (c) functional groups containing said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons;

R<sub>1</sub> and R<sub>2</sub> are spacing groups for providing an appropriate 3-dimensional scaffolding to allow molecules to pack together while providing rotational space for each rotor, said spacing groups selected from the group consisting of: (a) hydrogen, (b) saturated or unsaturated hydrocarbon, and (c) substituted hydrocarbon;

J<sub>1</sub>, J<sub>2</sub>, J<sub>3</sub>, and J<sub>4</sub> are tuning groups to provide at least one appropriate functional effect selected from the group consisting of inductive effects, resonance effects, and steric effects, said tuning groups being selected from the group consisting of: (a) hydrogen, (b) hetero atoms selected from the group consisting of N, O, S, P, B, F, Cl, Br and I, (c) functional groups with at least one of said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons;

G<sub>1</sub> is a bridging group to connect either (a) a stator portion and a rotor portion of said molecular system or (b) at least two conjugated rings to achieve a desired chromophore, said bridging group selected from the group consisting of: (a) hetero atoms selected from the group consisting of N, O, S, and P, (b) functional groups with at least one of said hetero atoms, (c) saturated or unsaturated hydrocarbons, and (d) substituted hydrocarbons; and

W is an electron-withdrawing group for tuning reactivity of the maleic anhydride group of said molecular system, which enables said molecular system to undergo a smooth charge separation or recombination upon application of said electric field, said electron-withdrawing group selected from the group consisting of: (a) carboxylic acid and its derivatives, (b) nitro, (c) nitrile, (d) ketone, (e) aldehyde, (f) sulfone, (g)

sulfuric acid and its derivatives, (h) hetero atoms selected from the group consisting of F, Cl, Br, N, O and S, and (i) functional groups with at least one of said hetero atoms.

17. The optical switch of Claim 1 wherein said electric field induced band gap  
5 change occurs via molecular folding or stretching.

18. The optical switch of Claim 17 wherein said molecular system comprises  
three portions, a first portion and a third portion, each bonded to a second, central portion,  
wherein a change from a first state to a second state occurs with an applied electric  
10 field, said change involving a folding or stretching about or of said second portion,  
wherein in said first state, there is extended conjugation throughout said molecular system,  
resulting in a relatively smaller band gap state, and wherein in said second state,  
said extended conjugation is destroyed, resulting in a relatively larger band gap.

15 19. The optical switch of Claim 18 wherein said molecular system comprises:

Molecule Folding      ||      Stretching Out

$n = 0 \text{ to } 10$

where:

$R_1$  and  $R_2$  are spacing groups selected from the group consisting of: (a) hydrogen, (b) saturated or unsaturated hydrocarbons, and (c) substituted hydrocarbons;

5        $J_1, J_2, J_3, J_4$  and  $J_5$  are tuning groups to provide at least one appropriate functional effect selected from the group consisting of inductive effects, resonance effects, and steric effects, said tuning groups being selected from the group consisting of: (a) hydrogen, (b) hetero atoms selected from the group consisting of N, O, S, P, B, F, Cl, Br and I, (c) functional groups with at least one of said hetero atoms, (d) saturated or 10 unsaturated hydrocarbons, and (e) substituted hydrocarbons; and

$Y$  and  $Z$  are functional groups that form inter-molecular or intra-molecular hydrogen bonding and are selected from the group consisting of: (a) SH, (b) OH, (c) amine, (d) hydrocarbons, and (e) substituted hydrocarbons.

20. The optical switch of Claim 1 wherein said molecular system is bi-stable, which provides a non-volatile component.

5 21. The optical switch of Claim 1 wherein said molecular system has essentially a low activation barrier between different states to provide a fast, but volatile, switch.

10 22. The optical switch of Claim 1 wherein said molecular system has more than two switchable states, such that optical properties of said molecular system can be tuned by either continuously by application of a decreasing or increasing electric field to form a volatile switch or the color is changed abruptly by the application of voltage pulses to a switch with at least one activation barrier.

15 23. The optical switch of Claim 1 wherein said molecular system changes between a transparent state and a colored state.

24. The optical switch of Claim 1 wherein said molecular system changes between one colored state and another colored state.

20 25. The optical switch of Claim 1 wherein said molecular system changes between one index of refraction and another index of refraction.

26. A molecular system capable of undergoing an electric field induced band gap change that occurs via one of the following mechanisms:

25 (1) molecular conformation change or an isomerization;  
(2) change of extended conjugation via chemical bonding change to change the band gap; or  
(3) molecular folding or stretching.

30 27. The molecular system of Claim 26 wherein said electric field induced band gap change occurs via molecular conformation change or an isomerization.

28. The molecular system of Claim 27 comprising at least one stator portion and at least one rotor portion, wherein said rotor rotates from a first state to a second state with an applied electric field, wherein in said first state, there is extended conjugation throughout said molecular system, resulting in a relatively smaller band gap, and wherein in said second state, said extended conjugation is destroyed, resulting in a relatively larger band gap.

29. The molecular system of Claim 28 comprising:

where:

15      A<sup>-</sup> is an Acceptor group comprising an electron-withdrawing group selected from the group consisting of: (a) hydrogen, (b) carboxylic acid and its derivatives, (c) sulfuric acid and its derivatives, (d) phosphoric acid and its derivatives, (e) nitro, (f) nitrile, (g) hetero atoms selected from the group consisting of N, O, S, P, F, Cl, and Br, (h) functional groups with at least one of said hetero atoms, (i) saturated or unsaturated hydrocarbons, and (j) substituted hydrocarbons;

20      D<sup>+</sup> is a Donor group comprising an electron-donating group selected from the group consisting of: (a) hydrogen, (b) amines, (c) OH, (d) SH, (e) ethers, (f) saturated or unsaturated hydrocarbon, (g) substituted hydrocarbons, and (h) functional groups with at least one hetero atom selected from the group consisting of B, Si, I, N, O, S, and P, wherein said Donor group is more electropositive than said Acceptor group;

25      Con<sub>1</sub> and Con<sub>2</sub> are connecting units between one molecule and another molecule or between a molecule and a solid substrate selected from the group consisting of

a metal electrode, an inorganic substrate, and an organic substrate, said connecting units independently selected from the group consisting of: (a) hydrogen (utilizing a hydrogen bond), (b) multivalent hetero atoms selected from the group consisting of C, N, O, S, and P, (c) functional groups containing said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons; and

SA and SB designate Stator A and Stator B, respectively, which may be the same or different and which are independently selected from the group consisting of (a) unsaturated or saturated hydrocarbons and (b) substituted hydrocarbons, wherein said hydrocarbon units contain conjugated rings that contribute to an extended conjugation of the molecule when it is in a planar state (red shifted state), wherein said stators optionally and separately contain at least one bridging group  $G_n$ , at least one spacing group  $R_n$ , or both, wherein said at least one bridging group is either (a) selected from the group consisting of acetylene, ethylene, amide, imide, imine, and azo and is used to connect said stators to said rotor or to connect at least two conjugated rings to achieve a desired chromophore or (b) selected from the group consisting of a single atom bridge and a direct sigma bond between said rotor and said stators and wherein said at least one spacing group is selected from the group consisting of phenyl, isopropyl, and tert-butyl and is used to provide an appropriate 3-dimensional scaffolding to allow molecules to pack together while providing rotational space for each rotor to rotate over a desired range of motion.

30. The molecular system of Claim 29 comprising:

5 where:

$A^-$  is said Acceptor group;

$D^+$  is said Donor group;

$Con_1$  and  $Con_2$  are said connecting units;

10  $R_1$ ,  $R_2$ ,  $R_3$  are said spacing groups, which are independently selected from the group consisting of: (a) hydrogen, (b) saturated or unsaturated hydrocarbons, and (c) substituted hydrocarbons; and

$G_1$ ,  $G_2$ ,  $G_3$ , and  $G_4$  are said bridging groups, which are independently selected from the group consisting of: (a) hetero atoms selected from the group consisting of

N, O, S, and P, (b) functional groups with at least one of said hetero atoms, (c) saturated or unsaturated hydrocarbons, and (d) substituted hydrocarbons.

31. The molecular system of Claim 28 comprising:

where:

A<sup>-</sup> is an Acceptor group comprising an electron-withdrawing group selected from the group consisting of: (a) hydrogen, (b) carboxylic acid and its derivatives, (c) 10 sulfuric acid and its derivatives, (d) phosphoric acid and its derivatives, (e) nitro, (f) nitrile, (g) hetero atoms selected from the group consisting of N, O, S, P, F, Cl, and Br, (h) functional groups with at least one of said hetero atoms, (i) saturated or unsaturated hydrocarbons, and (j) substituted hydrocarbons;

D<sup>+</sup> is a Donor group comprising an electron-donating group selected from the 15 group consisting of: (a) hydrogen, (b) amines, (c) OH, (d) SH, (e) ethers, (f) saturated or unsaturated hydrocarbon, (g) substituted hydrocarbons, and (h) functional groups with at least one hetero atom selected from the group consisting of B, Si, I, N, O, S, and P, wherein said Donor group is more electropositive than said Acceptor group;

20 Con<sub>1</sub> and Con<sub>2</sub> are connecting units between one molecule and another molecule or between a molecule and a solid substrate selected from the group consisting of a metal electrode, an inorganic substrate, and an organic substrate, said connecting units independently selected from the group consisting of: (a) hydrogen (utilizing a hydrogen bond), (b) multivalent hetero atoms selected from the group consisting of C, N, O, S, and P, (c) functional groups containing said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons; and

25 SA and SB designate Stator A and Stator B, respectively, which may be the same or different and which are independently selected from the group consisting of

(a) unsaturated or saturated hydrocarbons and (b) substituted hydrocarbons, wherein said hydrocarbon units contain conjugated rings that contribute to an extended conjugation of the molecule when it is in a planar state (red shifted state), wherein said stators optionally and separately contain at least one bridging group  $G_n$ , at least one spacing group  $R_n$ , or both, wherein said at least one bridging group is either (a) selected from the group consisting of acetylene, ethylene, amide, imide, imine, and azo and is used to connect said stators to said rotor or to connect at least two conjugated rings to achieve a desired chromophore or (b) selected from the group consisting of a single atom bridge and a direct sigma bond between said rotor and said stators and wherein said at least one spacing group is selected from the group consisting of phenyl, isopropyl, and tert-butyl and is used to provide an appropriate 3-dimensional scaffolding to allow molecules to pack together while providing rotational space for each rotor to rotate over a desired range of motion.

15           32. The molecular system of Claim 31 comprising:

where:

5       $A^-$  is said Acceptor group;  
 $D^+$  is said Donor group;  
 $Con_1$  and  $Con_2$  are said connecting units;  
 $R_1$ ,  $R_2$  and  $R_3$  are said spacing groups, which are independently selected from the group consisting of: (a) hydrogen, (b) saturated or unsaturated hydrocarbons, and (c) substituted hydrocarbons;

$G_1, G_2, G_3, G_4, G_5, G_6, G_7$ , and  $G_8$  are said bridging groups, which are independently selected from the group consisting of: (a) hetero atoms selected from the group consisting of N, O, S, and P, (b) functional groups with at least one of said hetero atoms, (c) saturated or unsaturated hydrocarbons, and (d) substituted hydrocarbons; and

$J_1$  and  $J_2$  are tuning groups to provide at least one appropriate functional effect selected from the group consisting of inductive effects, resonance effects, and steric effects, said tuning groups being selected from the group consisting of: (a) hydrogen, (b) hetero atoms selected from the group consisting of N, O, S, P, B, F, Cl, Br and I, (c) functional groups with at least one of said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons.

33. The molecular system of Claim 26 wherein said electric field induced band gap occurs via a change of extended conjugation via chemical bonding change to change the band gap.

34. The molecular system of Claim 33 wherein said electric field induced band gap change occurs via a change of extended conjugation via charge separation or recombination accompanied by increasing or decreasing band localization.

20

35. The molecular system of Claim 34 comprising two portions, wherein a change from a first state to a second state occurs with an applied electric field, said change involving charge separation in changing from said first state to said second state, thereby resulting in a relatively larger band gap state, with less  $\pi$ -delocalization, and recombination of charge in changing from said second state to said first state, thereby resulting in a relatively smaller band gap state, with greater  $\pi$ -delocalization.

30

36. The molecular system of Claim 35 comprising:

where:

5  $J_1, J_2, J_3, J_4$  and  $J_5$  are tuning groups to provide at least one appropriate functional effect selected from the group consisting of inductive effects, resonance effects,

and steric effects, said tuning groups being selected from the group consisting of: (a) hydrogen, (b) hetero atoms selected from the group consisting of N, O, S, P, B, F, Cl, Br and I, (c) functional groups with at least one of said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons;

5         $G_1$  is a bridging group to connect at least two conjugated rings to achieve a desired chromophore, said bridging group selected from the group consisting of: (a) hetero atoms selected from the group consisting of N, O, S, and P, (b) functional groups with at least one of said hetero atoms, (c) saturated or unsaturated hydrocarbons, and (d) substituted hydrocarbons; and

10         $W$  is an electron-withdrawing group for tuning reactivity of the maleic anhydride group of said molecular system, which enables said molecular system to undergo a smooth charge separation or recombination upon application of said electric field, said electron-withdrawing group selected from the group consisting of: (a) carboxylic acid and its derivatives, (b) nitro, (c) nitrile, (d) ketone, (e) aldehyde, (f) sulfone, (g) 15 sulfuric acid and its derivatives, (h) hetero atoms selected from the group consisting of F, Cl, Br, N, O and S, and (i) functional groups with at least one of said hetero atoms.

37. The molecular system of Claim 35 comprising:

where:

5  $J_1, J_2, J_3, J_4$  and  $J_5$  are tuning groups to provide at least one appropriate functional effect selected from the group consisting of inductive effects, resonance effects, and steric effects, said tuning groups being selected from the group consisting of: (a) hydrogen, (b) hetero atoms selected from the group consisting of N, O, S, P, B, F, Cl, Br and I, (c) functional groups with at least one of said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons;

$G_1$  is a bridging group to connect at least two conjugated rings to achieve a desired chromophore, said bridging group selected from the group consisting of: (a) hetero atoms selected from the group consisting of N, O, S, and P, (b) functional groups with at least one of said hetero atoms, (c) saturated or unsaturated hydrocarbons, and

5 (d) substituted hydrocarbons; and

$M^+$  is selected from the group consisting of transition metals, their halogen complexes,  $H^+$ , and Lewis acids.

38. The molecular system of Claim 33 wherein said electric field induced band gap occurs via a change of extended conjugation via charge separation or recombination and  $\pi$ -bond breaking or formation.

39. The molecular system of Claim 38 wherein said molecular system comprises two portions, wherein a change from a first state to a second state occurs with an applied electric field, said change involving charge separation in changing from said first state to said second state, wherein in said first state, there is extended conjugation throughout said molecular system, resulting in a relatively larger band gap state, and wherein in said second state, said extended conjugation is destroyed and separated positive and negative charges are created within said molecular system, resulting in a relatively smaller band gap state.

20  
40. The molecular system of Claim 39 comprising:

where:

Q is a connecting unit between two phenyl rings and is selected from the group consisting of: S, O, NH, NR, hydrocarbon, or substituted hydrocarbon;

Con<sub>1</sub> and Con<sub>2</sub> are connecting units between one molecule and another molecule or between a molecule and a solid substrate selected from the group consisting of a metal electrode, an inorganic substrate, and an organic substrate, said connecting units independently selected from the group consisting of: (a) hydrogen (utilizing a 5 hydrogen bond), (b) multivalent hetero atoms selected from the group consisting of C, N, O, S, and P, (c) functional groups containing said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons;

R<sub>1</sub> and R<sub>2</sub> are spacing groups for providing an appropriate 3-dimensional scaffolding to allow molecules to pack together while providing rotational space for each 10 rotor, said spacing groups selected from the group consisting of: (a) hydrogen, (b) saturated or unsaturated hydrocarbon, and (c) substituted hydrocarbon;

J<sub>1</sub>, J<sub>2</sub>, J<sub>3</sub>, and J<sub>4</sub> are tuning groups to provide at least one appropriate functional effect selected from the group consisting of inductive effects, resonance effects, and steric effects, said tuning groups being selected from the group consisting of: (a) hydrogen, (b) hetero atoms selected from the group consisting of N, O, S, P, B, F, Cl, Br 15 and I, (c) functional groups with at least one of said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons;

G<sub>1</sub> is a bridging group to connect either (a) a stator portion and a rotor portion of said molecular system or (b) at least two conjugated rings to achieve a desired 20 chromophore, said bridging group selected from the group consisting of: (a) hetero atoms selected from the group consisting of N, O, S, and P, (b) functional groups with at least one of said hetero atoms, (c) saturated or unsaturated hydrocarbons, and (d) substituted hydrocarbons; and

W is an electron-withdrawing group for tuning reactivity of the maleic anhydride group of said molecular system, which enables said molecular system to undergo a smooth charge separation or recombination upon application of said electric field, said electron-withdrawing group selected from the group consisting of: (a) carboxylic acid and its derivatives, (b) nitro, (c) nitrile, (d) ketone, (e) aldehyde, (f) sulfone, (g) sulfuric acid and its derivatives, (h) hetero atoms selected from the group consisting of 30 F, Cl, Br, N, O and S, and (i) functional groups with at least one of said hetero atoms.

41. The molecular system of Claim 39 wherein said molecular system comprises:

where:

Q is a connecting unit between two phenyl rings and is selected from the group consisting of: S, O, NH, NR, hydrocarbon, or substituted hydrocarbon;

Con<sub>1</sub> and Con<sub>2</sub> are connecting units between one molecule and another molecule or between a molecule and a solid substrate selected from the group consisting of a metal electrode, an inorganic substrate, and an organic substrate, said connecting units independently selected from the group consisting of: (a) hydrogen (utilizing a hydrogen bond), (b) multivalent hetero atoms selected from the group consisting of C, N, O, S, and P, (c) functional groups containing said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons;

R<sub>1</sub> and R<sub>2</sub> are spacing groups for providing an appropriate 3-dimensional scaffolding to allow molecules to pack together while providing rotational space for each rotor, said spacing groups selected from the group consisting of: (a) hydrogen, (b) saturated or unsaturated hydrocarbon, and (c) substituted hydrocarbon;

J<sub>1</sub>, J<sub>2</sub>, J<sub>3</sub>, and J<sub>4</sub> are tuning groups to provide at least one appropriate functional effect selected from the group consisting of inductive effects, resonance effects, and steric effects, said tuning groups being selected from the group consisting of: (a) hydrogen, (b) hetero atoms selected from the group consisting of N, O, S, P, B, F, Cl, Br and I, (c) functional groups with at least one of said hetero atoms, (d) saturated or unsaturated hydrocarbons, and (e) substituted hydrocarbons;

G<sub>1</sub> is a bridging group to connect either (a) a stator portion and a rotor portion of said molecular system or (b) at least two conjugated rings to achieve a desired chromophore, said bridging group selected from the group consisting of: (a) hetero atoms selected from the group consisting of N, O, S, and P, (b) functional groups with at least one of said hetero atoms, (c) saturated or unsaturated hydrocarbons, and (d) substituted hydrocarbons; and

W is an electron-withdrawing group for tuning reactivity of the maleic anhydride group of said molecular system, which enables said molecular system to undergo a smooth charge separation or recombination upon application of said electric field, said electron-withdrawing group selected from the group consisting of: (a) carboxylic acid and its derivatives, (b) nitro, (c) nitrile, (d) ketone, (e) aldehyde, (f) sulfone, (g)

sulfuric acid and its derivatives, (h) hetero atoms selected from the group consisting of F, Cl, Br, N, O and S, and (i) functional groups with at least one of said hetero atoms.

42. The molecular system of Claim 26 wherein said electric field induced band  
5 gap change occurs via molecular folding or stretching.

43. The molecular system of Claim 42 wherein said molecular system comprises  
three portions, a first portion and a third portion, each bonded to a second, central por-  
tion, wherein a change from a first state to a second state occurs with an applied electric  
10 field, said change involving a folding or stretching about or of said second portion,  
wherein in said first state, there is extended conjugation throughout said molecular sys-  
tem, resulting in a relatively smaller band gap state, and wherein in said second state,  
said extended conjugation is destroyed, resulting in a relatively larger band gap.

15 44. The molecular system of Claim 43 wherein said molecular system com-  
prises:

where:

$R_1$  and  $R_2$  are spacing groups selected from the group consisting of: (a) hydrogen, (b) saturated or unsaturated hydrocarbons, and (c) substituted hydrocarbons;

5        $J_1$ ,  $J_2$ ,  $J_3$ ,  $J_4$  and  $J_5$  are tuning groups to provide at least one appropriate functional effect selected from the group consisting of inductive effects, resonance effects, and steric effects, said tuning groups being selected from the group consisting of: (a) hydrogen, (b) hetero atoms selected from the group consisting of N, O, S, P, B, F, Cl, Br and I, (c) functional groups with at least one of said hetero atoms, (d) saturated or  
10 unsaturated hydrocarbons, and (e) substituted hydrocarbons; and

$Y$  and  $Z$  are functional groups that form inter-molecular or intra-molecular hydrogen bonding and are selected from the group consisting of: (a) SH, (b) OH, (c) amine, (d) hydrocarbons, and (e) substituted hydrocarbons.
